

What IS

Meningitis?

("men-in-jai-tis")

QUINTETStudy

InQUIring INTO the potential of a
penTavalent mENingiTiS vaccine

- **Meningitis** is an **uncommon but serious disease** caused by different types of germs
- The disease can cause **serious health problems** in people, including an infection in the brain and spinal cord, hearing loss, loss of a limb, and skin scarring. In some cases, meningitis can cause death
- Meningitis germs spread through close personal contact, such as **kissing, coughing, and sneezing**

What IS the Quintet Study?

In the **QUINTET Research Study**, doctors and researchers want to learn how well a study combination ABCWY vaccine works in helping to protect against the different kinds of meningitis germs and how safe this investigational vaccine is when compared with the 2 types of vaccines currently used to help protect against meningitis.

You may be able to join this study if you*

- are between the ages of 10 and 25 years old
- have never received a vaccine for the **meningitis A, B, C, W, and Y** (your parent, caregiver, or doctor will know if you are not sure)

*Additional eligibility criteria apply. You and your parent should speak with the study team to learn more.

- Although anyone can become infected with meningitis, it is most commonly diagnosed in **infants, young children, teens, and young adults**

About **3,650** **children and young adults** will take part in this study at sites all around the world.

Learn More

Ask your doctor, parent, or caregiver if you want to learn more about the study. He or she can also help you contact the study team, who can answer any questions you may have.
